Dear business partners and friends of ValueTrust,

We are pleased to release our fourteenth edition of the ValueTrust DACH¹) Capital Market Study for Q4 2023 carried out in cooperation with finexpert and the Institute of Accounting and Auditing at the WU Vienna.

In this Study, we provide certain **cost of capital inputs required to perform an enterprise valuation** in Germany, Austria and Switzerland:

- the relevant parameters used to calculate the cost of capital under the CAPM, including risk-free rate, market risk premium and beta;
- implied and historical market/sector returns;
- capital structure-adjusted implied sector returns, which serve as an indicator for the unlevered cost of equity (the relevered cost of equity can be calculated by adapting the company specific debt situation to the unlevered cost of equity, serving as an alternative to the CAPM);
- an analysis of empirical (ex-post) cost of equity in the form of total shareholder returns consisting of capital gains and dividends (total shareholder returns can be used as a plausibility check for the implied (ex-ante) returns);
- a trading multiples overview.

We examine the relevant cost of capital parameters for the German, Austrian and Swiss capital markets in form of the CDAX², WBI³ and SPI⁴. The constituents of these indices were allocated to twelve finexpert sector indices (so-called "super sectors"): Banking, Insurance, Financial Services, Consumer Service, Consumer Goods, Pharma & Healthcare, Information Technology, Telecommunication, Utilities, Basic Materials, Industrials and Real Estate.

Historical data was compiled between the reference dates 31 December 2017 and 31 December 2023, and is updated semi-annually with the objective to track capital market performance over time.

Further knowledge and information for financial decision making is provided at www.finexpert.info.

DISCLAIMER

This Study presents an empirical analysis which serves the purpose of illustrating the cost of capital of Germany's, Austria's, and Switzerland's capital markets. The available information and the corresponding exemplifications do not allow for a complete presentation of a proper derivation of cost of capital. Furthermore, the market participant must consider that the company specific cost of capital can vary widely due to individual corporate circumstances.

The listed information is not specific to anyone and consequently, it cannot be directed to an individual or juristic person. Although we are always striving for reliable, accurate and current information, we cannot guarantee that the data is applicable in current and future valuation analyses. The same applies to the underlying data from the data provider S&P Capital IQ.

We recommend a self-contained, technical, and detailed analysis of the specific situation and we dissuade from acting solely based on the information provided.

ValueTrust and its co-authors do not assume any responsibility or liability for the up-to-datedness, completeness or accuracy of this Study or its contents.

Executive summary

The implied market risk premium decreased for Germany over the past 6 months due to a higher risk-free rate, and increased for Switzerland due to a higher implied market return

Market risk premium and trading multiples by country, Q4 2023

RISK-FREE RATE

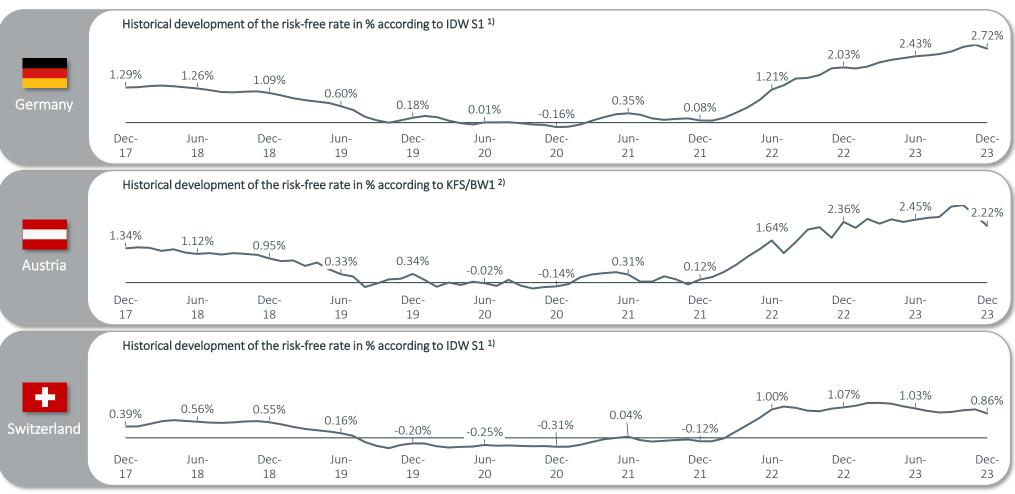

Germany's risk-free rate experienced a 29 bps increase in the last 6 months to 2.72%, while Austria decreased 23 bps to 2.22% and Switzerland decreased 17 bps to 0.86%

Risk-free rate for Germany, Austria and Switzerland based on long-term bonds (Svensson method), 31 December 2023

While the Swiss and Austrian risk-free rates decreased compared to June 2023, Germany reached a new peak in the observation period

Historical risk-free rate by country since 31 December 2017, in %

1. Interest rate as of reference date using 3-month average yield curves in accordance with IDW S 1;

2. Interest rate calculated using the daily yield curve in accordance with KFS/BW 1 (no 3-month average).00

Market returns and risk premium a. Implied returns (ex-ante analysis)

MARKET RETURNS AND MARKET RISK PREMIUM: IMPLIED RETURNS

The implied market risk premium increased 20 bps to 6.6% in Switzerland, declined 40 bps to 10.3% in Austria and decreased 70 bps to 6.9% in Germany due to weaker implied returns

Implied market risk premium by country since 2018, in %

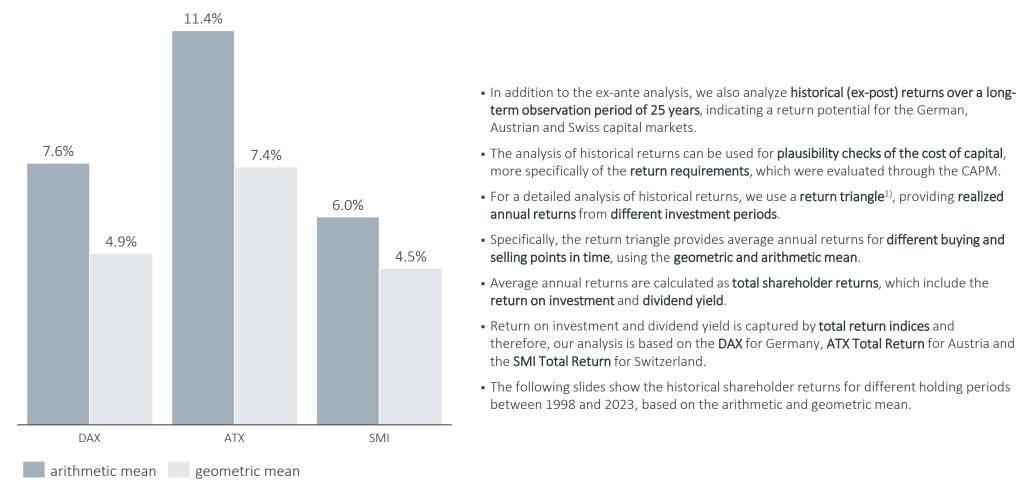

Market returns and risk premium b. Historical returns (ex-post analysis)

MARKET RETURNS AND MARKET RISK PREMIUM: HISTORICAL RETURNS

Over an investment period of 25 years, the Austrian capital market had the highest historical (arithmetic) returns (11.4%), followed by Germany (7.6%) and Switzerland (6.0%)

Arithmetic and geometric mean of historical market returns as of 31 December 2023, 1998-2023

1. The German Stock Institute e.V. (DAI) developed the return triangle for DAX and EURO STOXX.

MARKET RETURNS AND MARKET RISK PREMIUM: HISTORICAL RETURNS

Buy

With a return of 20.3% in the last 12 months, the DAX outperformed the ATX (15.4%) and SMI (7.1%)

24 | 31 December 2023

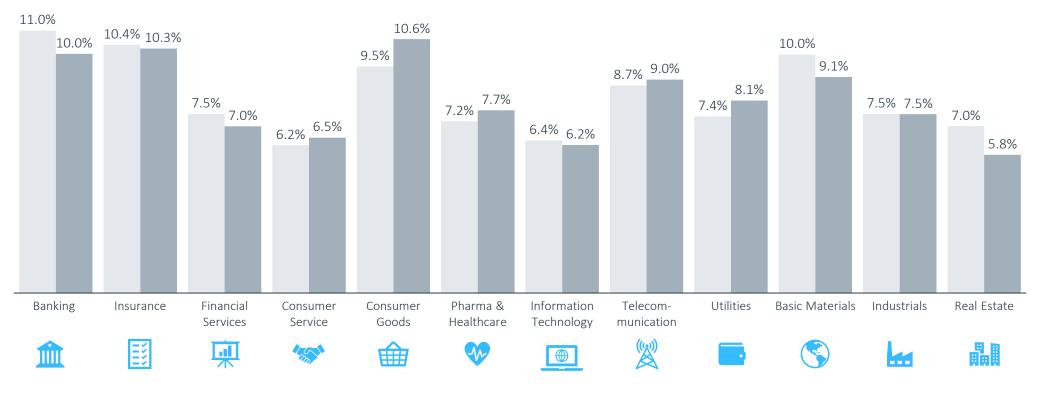

Sector returns

a. Implied returns (ex-ante analysis)

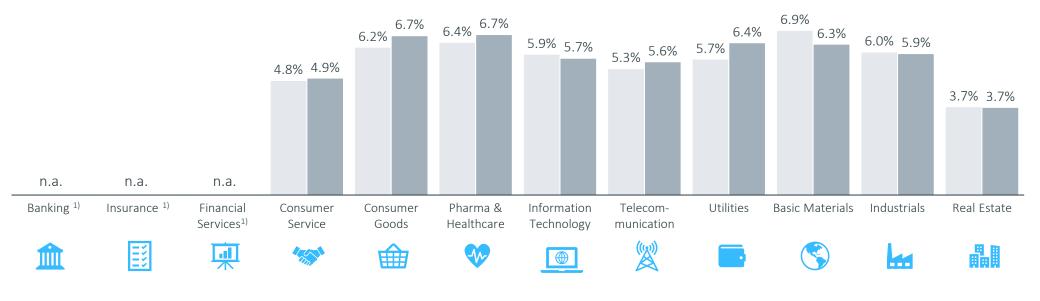

The implied levered return showed a mixed picture, while the Consumer Goods sector increased significantly, the Real Estate sector declined strongly over the last 6 months

Implied levered returns by sector, 31 December 2023 vs. 30 June 2023

The implied unlevered returns¹⁾ remain relatively stable, while it increased in the Utilities sector, the Basic Materials sector showed a decline

Implied unlevered returns by sector, 31 December 2023 vs. 30 June 2023

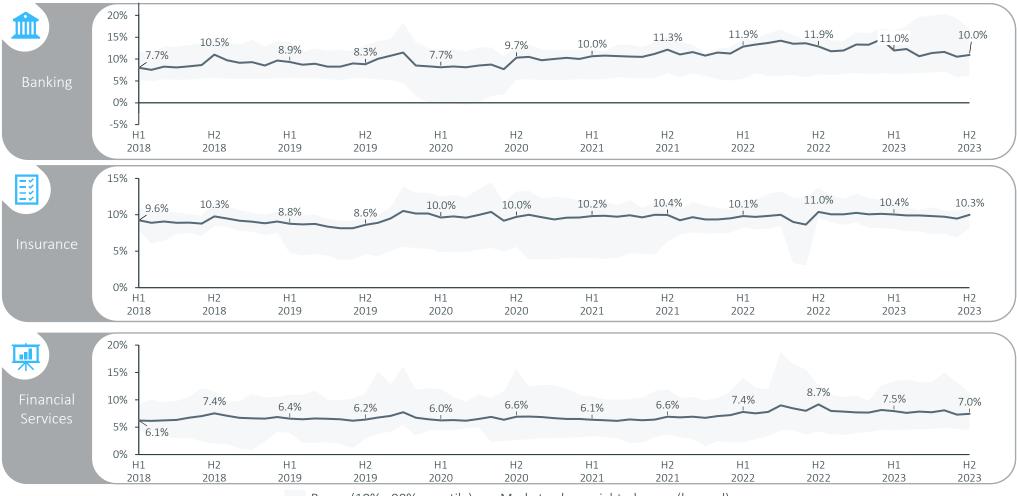

30 June 2023 🚺 31 December 2023

1. No unlevered returns are reported for the Banking, Insurance and Financial Services sector, as debt is part of operating activities.

The implied return of Banking, Insurance, and Financial Services sectors decreased towards the historical total share holder return level after reaching their peaks in December 2022

Implied levered sector returns since 2018

Range (10% - 90% quantile) — Market-value weighted mean (levered)

Implied sector returns for Pharma & Healthcare and Consumer Services have been relatively stable over time, while Consumer Goods showed more volatility at higher levered implied returns

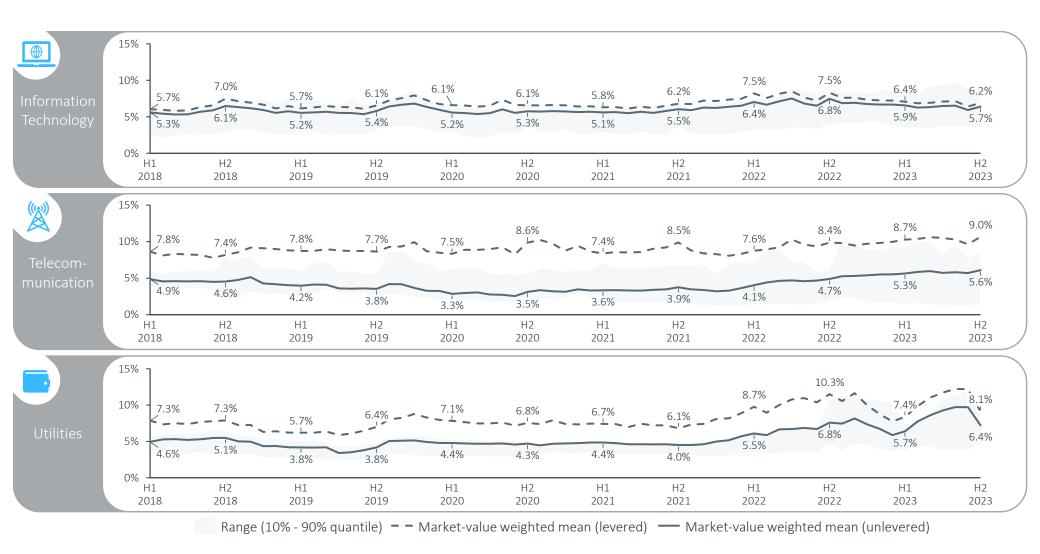

Levered and unlevered implied sector returns since 2018

Range (10% - 90% quantile) – – Market-value weighted mean (levered) – Market-value weighted mean (unlevered)

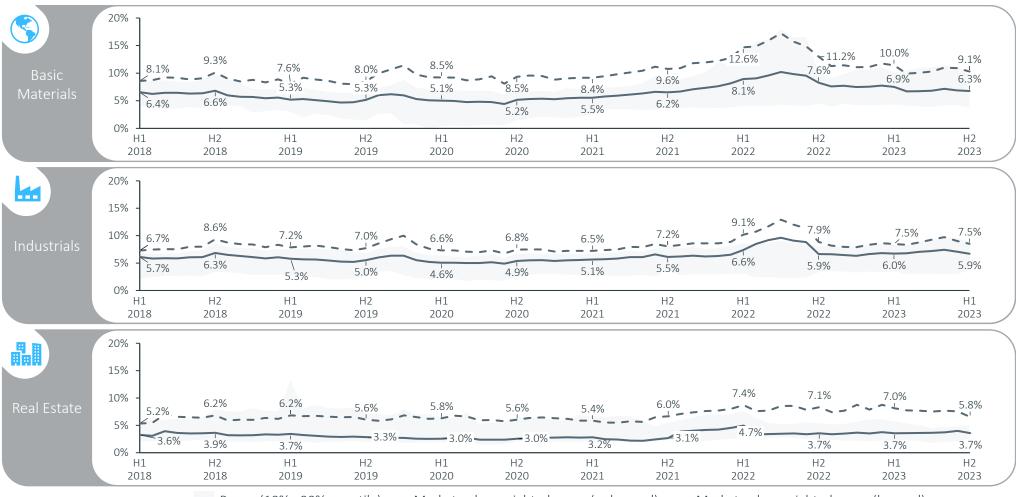

The implied return of the Telecommunication sector further increased since its low in 2021 and reached its peak due to the reduction of P/E multiples driven by earnings growth

Levered and unlevered implied sector returns since 2018

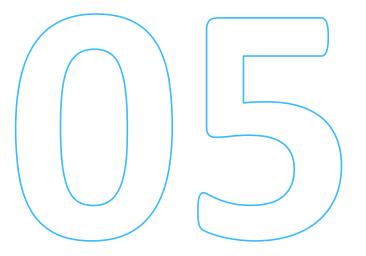

Implied returns of the Basic Materials and Real Estate sectors declined significantly; returns remained constant for the Industrial sector in the second half of 2023

Levered and unlevered implied sector returns since 2018

Range (10% - 90% quantile) — Market-value weighted mean (unlevered) – Market-value weighted mean (levered)

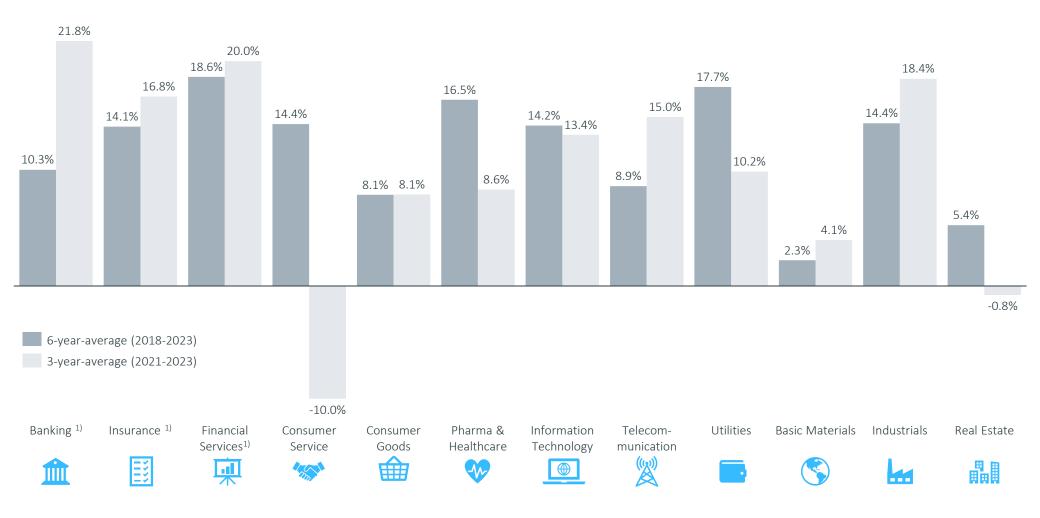

Sector returns

b. Historical returns (ex-post analysis)

Historical sector returns show varying impact of interest rate increases on sectors; Consumer Service sector returns were even negative while the Banking sector benefits from higher interest rates

Three- and six-year-average historical sector returns as of 31 December 2023

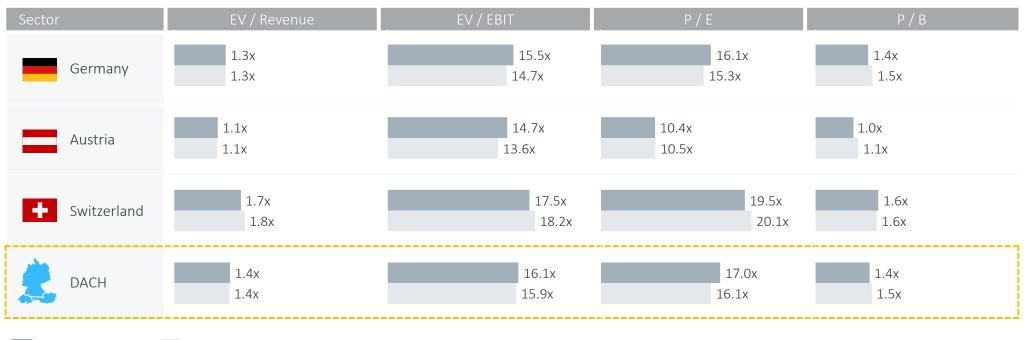

1. The returns for the sectors Banking, Insurance and Financial Services are levered sector returns. For all other sectors unlevered returns are displayed.

EV/EBIT and P/E multiples have slightly increased in the past 6 months; Switzerland continues to show the highest valuation levels, followed by Germany and Austria

Median forward multiples by country, 31 December 2023 and 30 June 2023

31 December 2023 30 June 2023

P/E multiples increased in the Banking and Financial Services, as market capitalization growth was higher than earnings estimates growth

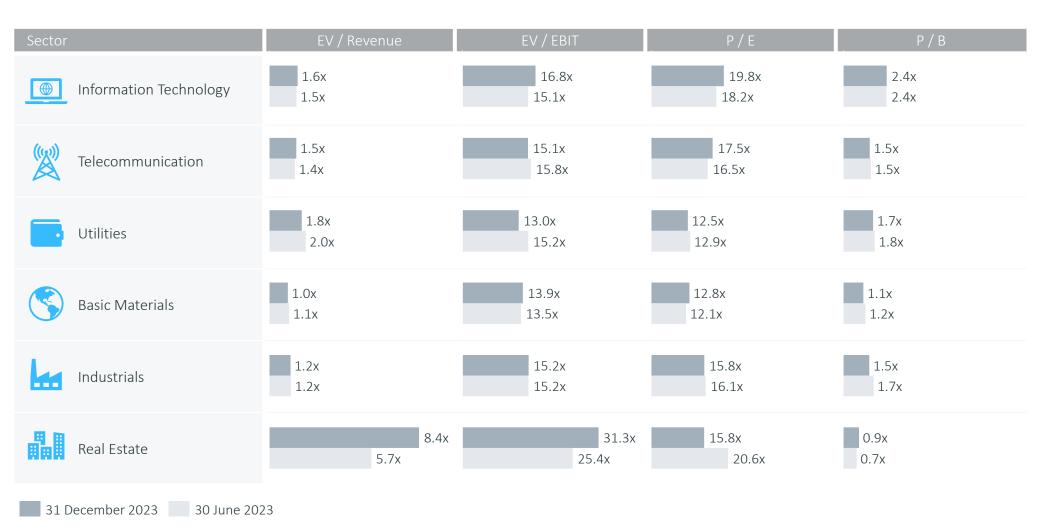

Median forward multiples by sector, 31 December 2023 and 30 June 2023

Sector	EV / Revenue	EV / EBIT	P / E	P / B
Banking	n.a.	n.a.	12.6x 10.7x	0.9x 0.8x

Appendix Background and approaches

VALUETRUST

German government bonds are used to derive risk-free rates for Germany and Austria, while the risk-free rate for Switzerland is based on Swiss government bonds

Risk-free rate

The **risk-free rate** is a return available on a security that the market generally regards as free of default risk. It serves as an input parameter for the **CAPM** and is used to determine the risk-adequate cost of capital.

The risk-free rate is a yield, which is obtained from **long-term government bonds** of countries with top notch ratings. By using interest rate data of different maturities, a **yield curve** can be estimated for fictitious zero-coupon bonds (spot rates) for a period of up to 30 years. The German Central Bank (Deutsche Bundesbank) and the Swiss National Bank (Schweizer Nationalbank) publish – on a daily basis – the parameters needed to determine the yield curve using the **Svensson method**. Based on the respective yield curve, a **uniform risk-free rate** is derived under the assumption of present value equivalence to an infinite time horizon.

The **German bonds** are internationally classified as **almost risk-free securities** due to their AAA rating according to S&P. As a result, the **Austrian** Chamber of Public Accountants and Tax Consultants also recommends deriving the risk-free rate from the yield curve using the parameters published by the German Central Bank.¹⁾ Likewise, bonds issued by **Switzerland** enjoy a AAA rating and are also considered risk-free according to the Swiss National Bank.²⁾ Hence, a similar approach as for Germany and Austria is in our view appropriate for Switzerland with Swiss parameters.³⁾ To compute the risk-free rate for a specific reference date, the **Institute of Public Auditors** (Institut der Wirtschaftsprüfer, **IDW**) in Germany recommends using an **average value** deduced from the daily yield curves over the **past three months** (IDW S 1).

In contrast, the Austrian Expert Opinion (KFS/BW 1) on company valuation recommends deriving the risk-free rate in line with the evaluated company's cash flow profile from the yield curve that is valid for the **reference date** (reference date principle). Consequently, in the following analyses, we depict the yield curve for Germany following IDW S 1, while for Austria we adhere to the recommendations of KFS/BW 1.

For **Switzerland**, there is no generally accepted recommendation as to the determination of the risk-free rate. The most widely used risk-free rates in valuation practice are the yield of a **10-year Swiss government bond** as of the reference date as well as the **yield derived from the 3-month average of the daily yield curves** (in accordance with IDW S 1).

The concept of implied cost of capital recently gained momentum

Market returns and market risk premium: Implied returns

The **future-oriented** computation of **implied market returns** and **market risk premiums** is based on profit estimates for public companies and return calculations. This approach is called ex-ante analysis and allows us to calculate the "**implied cost of capital**".

The **ex-ante method** offers an **alternative** to the **ex-post approach** of calculating the cost of capital by means of a regression analysis through the **CAPM**. The exante analysis method seeks cost of capital which represent the **return expectations of market participants**. The approach assumes that the estimates of financial analysts reflect the expectations of the capital market.

The concept of **implied cost of capital** recently gained momentum. For example, when it was recognized by the German *Fachausschuss für Unternehmensbewertung* "**FAUB**".¹⁾ It is acknowledged that implied cost of capital capture the **current capital market situation** and are thus able to reflect the effects of the current **low interest rate environment**.

Furthermore, recent **court rulings** with regards to appraisal proceedings appreciate the forward-looking nature of **implied cost of capital**. As of the **reference date**, it offers a more insightful perspective compared to the exclusive use of ex-post data.

In the analysis, we use – a simplified annual formula – the formula of the Residual Income Valuation Model by *Babbel*:²⁾

$$r_t = \frac{NI_{t+1}}{MC_t} + \left(1 - \frac{BV_t}{MC_t}\right) * g$$

- cf. Castedello/Jonas/Schieszl/Lenckner, Die Marktrisikoprämie im Niedrigzinsumfeld Hintergrund und Erläuterung der Empfehlung des FAUB (WPg, 13/2018, p. 806-825);
- cf. Babbel, Challenging Stock Prices: Stock prices und implied growth expectations, in: Corporate Finance, N. 9, 2015, p. 316-323, in particular p. 319. In the observation period from H2 2020 until H2 2021, we applied t+2 earnings forecasts in our model due to distortions by the COVID-19 crisis;

With the following parameter definitions:

- r_t = Cost of equity at time t
- $NI_{t+1}\mbox{=}$ Expected net income in the following time period t+1
- MC_t = Market capitalization at time t
- BV_t = Book value of equity at time t
- g = Projected growth rate

By solving the model for the cost of capital, we obtain the implied return on equity.³⁾ Since *Babbel's* model does not need any explicit assumptions except for the growth rate it turns out to be **robust**. We source all data (i.e. expected annual net income, market capitalization, and book value of equity, etc.) of the analyzed companies from the data supplier S&P Capital IQ. As a typified growth rate, we apply the European Central Bank target inflation rate of **2.0% as a typified growth rate**.

We determine the **implied market returns** for the DAX, ATX and SMI. We consider these indices to be a valid approximation for the total markets.⁴⁾ Subtracting the risk-free rate from the implied market returns results in the implied market risk premium.

To determine the appropriate market risk premium for valuation purposes, it is also important to take into account historical returns and volatility. Especially in times of crisis it may make sense to apply an average market risk premium over several periods instead of a reference date value.

cf. Reese, 2007, Estimation of the cost of capital for evaluation purposes; Aders/Aschauer/Dollinger, Die implizite Marktrisikoprämie am österreichischen Kapitalmarkt (RWZ, 6/2016, p. 195-202);

^{4.} Approx. 75% of the total market capitalization (CDAX, WBI, SPI) is covered.

Betas are calculated based on regressions and adjusted to take the capital structure into account

Betas

Beta is used in the **CAPM** and also referred to as beta coefficient or beta factor. Beta is a measure of **systematic risk** of a security of a specific company (**company beta**) or a specific sector (**sector beta**) in comparison to the market. A beta of less than 1 means that the security is theoretically less **volatile** than the market. A beta of greater than 1 indicates that the security's price is more volatile than the market.

Beta factors are estimated based on historical returns of securities in comparison to an approximate market portfolio. Since a company valuation is forward-looking, it has to be examined which risk factors from the past also apply to the future, and to which extent. In valuing non-listed companies or companies without meaningful share price performance, it is common practice to use a beta factor from a group of comparable companies ("peer group beta"), a suitable sector ("sector beta") or one single listed company in the capital market with a similar business model and similar risk profile ("pure play beta"). Within this Capital Market Study, we have used sector betas which are computed as arithmetic means of the statistically significant beta factors of all companies of a particular sector.

The calculation of beta factors is usually accomplished through a **linear regression analysis**. We use the CDAX, WBI, and SPI as country specific reference indices.

It is important to set a time period over which the data is collected (**benchmark period**), and whether daily, weekly or monthly returns (**return interval**) are analyzed. In practice, it is common to use **observation periods of two years** with the regression of **weekly returns** or **five years** with the regression of **monthly returns**. Both alternatives are displayed in our Study.

In the CAPM, company specific **risk premiums** include **business** risk, and financial **risk**. The beta factor of levered companies ("**levered beta**") is usually higher compared to a company with an identical business model but without debt (due to financial risk). Hence, **changes in the capital structure** require an **adjustment of the betas** and therefore of the company specific risk premiums.

Various adjustment formulas are available to calculate the **unlevered beta**. We prefer to use the **adjustment formula by Harris/Pringle** which assumes a valuebased financing policy, stock-flow adjustments without time delay, uncertain tax shields and a so-called **debt beta**. We calculate the debt beta based on the respective company's rating or the average sector rating (if a company's rating is not available) through the application of the **credit spread** derived from the expected cost of debt. We do not adjust the credit spread for unsystematic risks. Capital market data, in particular historical market prices, is provided by the data supplier S&P Capital IQ.

Implied sector returns simplify the calculation of the levered cost of equity

Sector returns: Implied returns

Besides the future-oriented calculation of **implied market returns**, we also calculate **implied returns for sectors**. That offers an **alternative** to and simplification of the **ex-post analysis** of the company's cost of capital via the **CAPM**. Using this approach, the calculation of sector betas via regression analyses is not necessary.

The **implied sector returns** can be used as an **indicator** for the **sector specific levered cost of equity**, which already consider **sector specific leverage**.

The following return calculations are again based on the Residual Income Valuation Model by *Babbel*.¹⁾ The required data (i.e. net income, market capitalization, and book value of equity) are sourced from the data provider S&P Capital IQ. With regards to profit growth, we assume a growth rate of 2.0%.

We unlever the implied returns with the following **equation** for the **cost of equity**²⁾ to take into account the specific leverage:³⁾

$$\mathbf{r}_{\mathrm{E}}^{\mathrm{L}} = \mathbf{r}_{\mathrm{E}}^{\mathrm{U}} + \left(\mathbf{r}_{\mathrm{E}}^{\mathrm{U}} - \mathbf{R}_{\mathrm{f}}\right) * \frac{\mathrm{D}}{\mathrm{E}}$$

with:

 $r_{\rm E}^{\rm L}$ = Levered cost of equity $r_{\rm E}^{\rm U}$ = Unlevered cost of equity $R_{\rm f}$ = Risk-free rate $\frac{\rm D}{\rm E}$ = Debt⁴⁾-to-equity ratio

The **implied unlevered sector returns** serve as an indicator for the **aggregated** and **unlevered cost of equity** for **specific sectors**. The process of relevering a company's cost of capital to reflect a company specific debt situation (cf. calculation example on the next slide) can be accomplished without using the CAPM.

- cf. Babbel, Challenging Stock Prices: Share prices and implied growth expectations (Corporate Finance, n. 9, 2015, p. 316-323, especially p. 319); cf. Aders/Aschauer/Dollinger, Die implizite Marktrisikoprämie am österreichischen Kapitalmarkt (RWZ, 6/2016, p. 195-202);
- 2. In situations in which the debt betas in the market are distorted, we would have to adjust these betas to avoid unsystematic risks. For simplification reasons, we deviate from our typical analysis strategy to achieve the enterprise value (Debt beta > 0) and assume that the cost of debt are at the level of the risk-free rate. This process is designed by the so-called Practitioners formula (uncertain tax shields, debt beta = 0), cf. Pratt/Grabowski, Cost of Capital, 5th ed., 2014, p. 253;
- 3. We assume that the cash and cash equivalents are used entirely for operational purposes. Consequently, we do not deduct excess cash from the debt;
- "Debt" is defined as all interest-bearing liabilities. The debt illustration of the companies in the Banking, Insurance and Financial
 Services sector only serves an informational purpose. We will not implement an adjustment to these companies' specific debt (unlevered) because their indebtedness is part of their operational activities and economic risk.

VALUETRUST

An exemplary calculation of relevered cost of equity to adjust for the company specific capital structure

Sector returns: Implied returns

Calculation example:

As of the reference date 31 December 2023, we observe a sector specific, unlevered cost of equity of **6.3%** (market-value weighted mean) in the German Basic Materials sector. For the exemplary company X, which operates in the German Basic Materials sector, the following assumptions were made:

- Debt-to-equity ratio of X: 40%
- Risk-free rate: 2.72% (cf. slide 13)

Based on these inputs, we calculate the relevered cost of equity for company X with the adjustment formula:

 $r_{\rm E}^{\rm L}=$ 6.3% + (6.3% - 2.72%) * 40% = 7.8%

7.8% is the company's relevered cost of equity. In comparison, the levered cost of equity of the Basic Materials sector is **9.1%**, reflecting the sectors' lower average leverage.

Historical sector returns are calculated using market-weighted aggregated sector indices

Sector returns: Historical returns

In addition to historical market returns, we calculate historical sector returns. Our analysis contains total shareholder returns including share price development and dividend yield.

We calculate **total annual shareholder returns as of 31 December** for every listed company of CDAX, WBI, and SPI. We aggregate these returns market-value weighted **to sector returns**. Our calculations comprise the time period between 2018 and 2023.

Since total annual shareholder returns tend to fluctuate to a great extent, their explanatory power is limited. Therefore, we do not only calculate the 1-year market-value weighted means, but 3-year (2021-23) as well as the 6-year (2018-23) averages.

The multiples approach can be used for company valuation

Trading multiples

Besides income-based valuation models (earnings value, DCF), the **multiples approach** offers a practical approach for an enterprise value estimation. The multiples method estimates a subject company's value **relative** to another company's value. The enterprise value is derived by multiplying a reference value (revenue or earnings values are frequently used) of the subject company by the respective multiples of **comparable companies**.

Within this Study, we calculate the following **multiples for the "super-sectors"** as well as **for the DACH market** consisting of the German, Austrian and Swiss capital markets (CDAX, WBI and SPI):

- Revenue-Multiples ("EV¹/Revenue")
- EBIT-Multiples ("EV¹/EBIT")
- Price-to-Earnings-Multiples ("P/E")
- Price-to-Book Value-Multiples ("P/B")

Multiples are presented for the reference dates 31 December 2023 and 30 June 2023. The reference values are based on one-year forecasts of analysts (so called forward multiples, in the following **"1yf"**). Solely the Price-to-Book-Value-Multiples are calculated with book values as of the reference dates. We present **median** values.

We present historical multiples starting as of 30 June 2018 in the appendix and update the applied multiples **semi-annually at the predefined reference date (as of 31 December and as of 30 June)**.

For the purpose of **simplification**, we exclude negative multiples and multiples in the highest quantile (95%). The multiples in the lowest quantile (5%) build the lower limit.

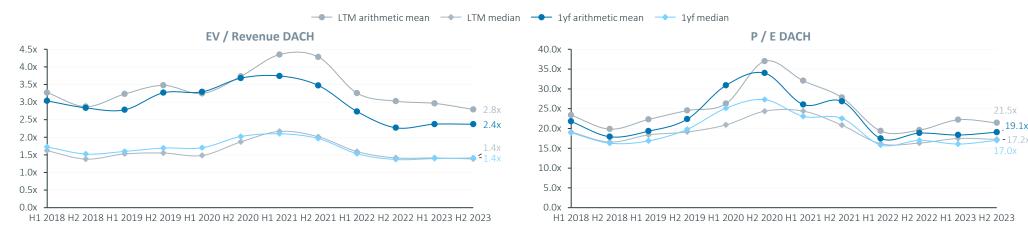

We source the data (i.e. market capitalization, revenue, EBIT, etc.) from the data provider S&P Capital IQ. Based on the availability of data, especially in terms of forecasts, the number of companies underlying each specific multiple varies.

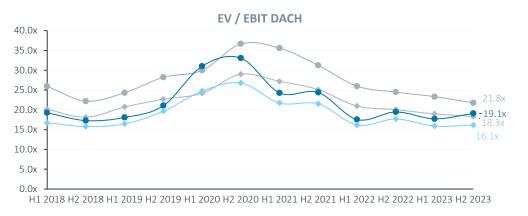

Additionally, we present a **ranking table** of the sector multiples. Sector multiples are sorted from highest to lowest for each analyzed multiple. The resulting score in the ranking is displayed in the table and visualized by a color code that assigns a dark **green color** to the **highest rank** and a **red color** to the **lowest rank**. Thus, a green colored high rank indicates a high valuation level, whereas a red colored low rank suggests a low valuation level. We then aggregate the rankings and calculate an average of all single rankings for each sector multiple. This is shown in the right column of the ranking table. This **average ranking** indicates the overall **relative valuation levels** of the sectors when using multiples.

Appendix Composition of the sectors of CDAX, WBI and SPI as of 31 December 2023

The capital market of the DACH region comprises 606 listed companies that are allocated to twelve sector indices

finexpert sector indices of the DACH region

The **finexpert** sector indices aim to cover the **entire capital market of the DACH region**. This Study contains all equities of the **German Composite DAX Index (CDAX)**, **Vienna Stock Exchange Index (WBI)** and **Swiss Performance Index (SPI)**. These three indices contain all shares listed on the **Official** and **Semi-Official Market**.

The **606 public companies**, which are listed in the mentioned indices as of 31 December 2023, build the base for the **sector classification** and the **subsequent analyses**:

- The German DAX Sector All Index¹⁾ includes 347 companies listed in the Prime Standard and General Standard and is grouped to nine "Deutsche Börse super sectors".
- The Austrian ATX has five sector indices, and ValueTrust allocates the remaining companies of the WBI to the twelve sector indices listed below.
- The Swiss SPI contains ten sector indices that comprise 202 companies.

finexpert allocated all constituents of three market indices and the respective sector index classifications to twelve **finexpert** sector indices, called "super sectors":

- Banking
- Insurance
- Financial Services
- Consumer Service
- Consumer Goods
- Pharma & Healthcare

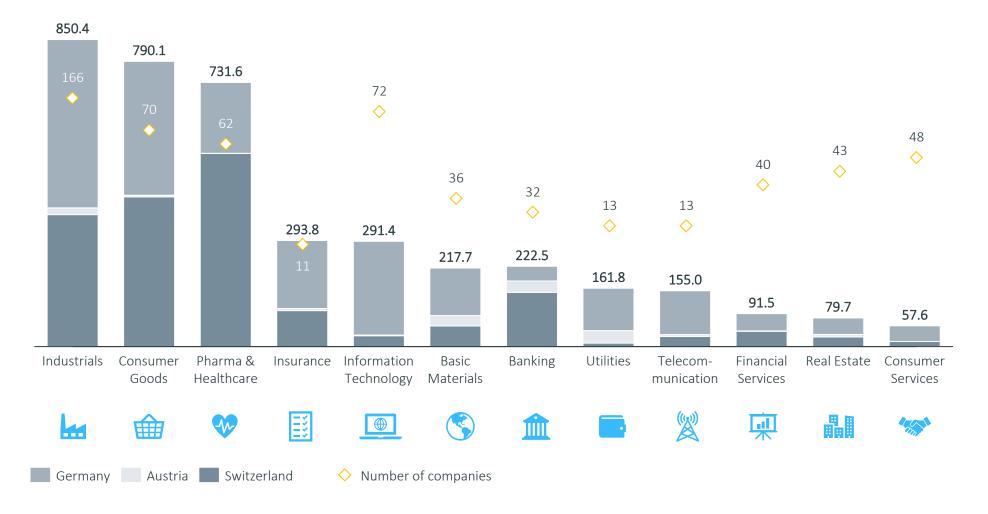

- Information Technology
- Telecommunication
- Utilities
- Basic Materials
- Industrials
- Real Estate

1. The DAX Sector All Index contains all equities listed in the Prime and General Standard as well as in the Scale segment of the Frankfurt stock exchange.

APPENDIX: COMPOSITION OF THE SECTORS OF CDAX, WBI AND SPI AS OF 31 DECEMBER 2023

Industrials, Consumer Goods and Pharma & Healthcare sectors represent over 60% of the market capitalization in the DACH region
